WHAT IS CLAIMED IS:

5u/h A6

1. A method for pre-coding in a communication system, comprising:

2 determining pre-coder parameters;

pre-coding first data in accordance with said determined pre-coder

4 parameters;

transmitting said pre-coded first data; and

6 transmitting non pre-coded first reference data/.

2. The method as claimed in claim 1/wherein determining a pre-2 coder parameters comprises:

receiving a reference data; and

- determining the pre-coder parameters in accordance with said received reference data and the reference data.
- 3. The method as claimed in claim 1 wherein determining a pre-2 coder parameters comprises:

receiving the non pre-coded first reference data;

- determining the pre-coder parameters in accordance with said received non pre-coded first reference data and/the first reference data; and
- 6 transmitting said determined p/e-coder parameters.
 - 4. The method as claimed in claim 3 further comprising: receiving said determined pre-coder parameters; and

receiving said determined pre-coder parameters; and providing said determined pre-coder parameters to the pre-coder.

5. The method as claimed in claim 1 wherein pre-coding first data in accordance with said determined parameters comprises:

pre-coding a payload data; and

- 4 pre-coding a dedicated pilot data.
- 6. The method of claim 1 wherein said transmitting a non pre-coded reference data comprises:

transmitting a dontinuous non pre-coded reference data.

4

The method of claim 1 wherein said transmitting a non pre-coded 7. 2 reference data comprises:

transmitting a discontinuous non pre-coded reference data.

8. The method of claim 1 wherein said transmitting a non pre-coded 2 reference data comprises: transmitting a pilot data.

- The method as claimed in claim 1, further comprising: 9. receiving the non pre-coded first reference data at least two antennae; equalizing each of said received non pre-coded first reference data by an equalizer and provide equalized non pre-coded first reference data;
- determining the pre-coder parameters/by adjusting characteristics of the 6 at least two equalizers in accordance with the received non pre-coded first reference data and the first reference data/and
- 8 transmitting said determined pre-coder parameters.
- The method as claimed/in claim 9 wherein said determining the 10. 2 pre-coder parameters by adjusting characteristics of the at least two equalizers in accordance with the received non pre-coded first reference data and the first 4 reference data comprises:

optimizing a quality metric of a composite data comprising the equalized 6 non pre-coded first reference data.

- 11. A method for demodulating pre-coded data, comprising:
- 2 receiving a reference data and a pre-coded data; and

determining demodulator parameters in accordance with the said 4

received reference data and the reference data; and

demodulating the pre-coded data in accordance with said determined demodulator parameters. 6

The method as plaimed in claim 11 wherein the reference data 12. 2 comprise a non pre-coded pilot signal.

The method as claimed in claim 11 wherein the reference data 13. comprise a pre-coded pilot signal. 14. The method as claimed in claim 11 wherein the reference data are 2 continuous reference data. The method as claimed in claim 11/wherein the reference data are 15. 2 discontinuous reference data. 16. An apparatus for pre-coding in a communication system, 2 comprising: a pre-coder configured to pre-code/data in accordance with pre-coder parameters; and 4 a first transmitter communicatively coupled to said pre-coder configured 6 to: transmit the pre-coded data; and 8 transmit a non pre-coded first reference data. 17. The apparatus as claimed in claim 16, further comprising: 2 a first receiver communicatively coupled to said pre-coder configured to receive a reference data; 4 a first processor communicatively coupled to said first receiver; and a storage medium communicatively coupled to said first processor and 6 containing a set of instructions executable by the processor to: determine the pre-coder parameters in accordance with said 8 received reference data/and the reference data. 18. The apparatus as claimed in claim 16, further comprising: a second receiver configured to receive the non pre-coded first reference 2 data; 4 a second processor/communicatively coupled to said second receiver; a storage medium/communicatively coupled to said first processor and

containing a set of instructions executable by the processor to:

4

4

determine the pre-coder parameters in accordance with said received non pre-coded first reference data and the non pre-coded first reference data; and

a second transmitter communicatively coupled to said second processor configured to transmitting said determined pre-coder parameters.

19. The apparatus as claimed in claim 18, wherein said first receiver 2 is further configured to:

receive said determined pre-coder parameters; and provide said received pre-coder parameters to said pre-coder.

20. The apparatus as claimed in claim 16 wherein said pre-coder is further configured to pre-code a second reference data in accordance with the determined parameters; and

wherein said first transmitter is further configured to transmit the precoded second reference data.

- 21. The apparatus as claimed in claim 16 wherein said first transmitter is further configured to transmit the non pre-coded first reference data continuously.
- 22. The apparatus as claimed in claim 16 wherein said first transmitter
 2 is further configured to transmit the non pre-coded first reference data discontinuously.
- 23. The apparatus of claim 16 wherein said non pre-coded first reference data comprise a pilot data.
- 24. The apparatus as claimed in claim 20 wherein said first transmitter to transmit the pre-coded second reference data continuously.
- 25. The apparatus as claimed in claim 20 wherein said first transmitter
 2 is further configured to transmit the pre-coded second reference data discontinuously.

8

2

demodulator parameters.

- The apparatus of claim 20 wherein said pre-coded second 26. 2 reference data comprise a dedicated pilot data. The apparatus as claimed in claim/16, further comprising: 27. 2 at least two equalizers configured to accept the received non pre-coded first reference data and provide equalized non pre-coded first reference data; a processor communicatively coupled/to said at least two equalizers; 4 a storage medium communicatively coupled to the processor and containing a set of instructions executable by the processor to determine said 6 pre-coder parameters by adjusting characteristics of the at least two equalizers in accordance with the received non pre-coded first reference data and the first 8 reference data; and a second transmitter communicatively coupled to said processor 10 configured to transmit the determined pre-coder parameters. The apparatus as ¢laimed in claim 16 wherein said processor 28. 2 determines said pre-coder characteristics by adjusting characteristics of the at least two equalizers in accordance with the non pre-coded first reference data the first reference data by executing a set of instructions to: 4 optimize a quality metri¢ of a composite data comprising the equalized 6 non pre-coded first reference/data. 29. An apparatus for demodulating pre-coded data, comprising: 2 a first receiver confidured to: receive a reference data and a pre-coded data; and determine demodulator parameters in accordance with the said 4 received reference data and the reference data; and
 - 30. The apparatus as claimed in claim 29 wherein the reference data comprise a non pre-coded pilot signal.

demodulate the pre-coded data in accordance with said determined

a demodulator communicatively coupled to said receiver configured to

Sub A 31. The apparatus as claimed in claim 29 wherein the reference data 2 comprise a pre-coded pilot signal.

- 32. The apparatus as claimed in claim 29 wherein the reference data are continuous reference data.
- 33. The apparatus as claimed in claim 29 wherein the reference data 2 are discontinuous reference data.
 - 34. A digital signal processing apparatus for pre-coding in a

2 communication system, comprising:

memory storage unit; and

- a digital signal processor communicatively coupled to said memory storage unit, and capable of executing instructions to:
- 6 determine pre-coder parameters;

pre-code first data in accordance with the determined pre-coder

8 parameters; and

assist in preparing the pre-coded first data and non pre-coded first 10 reference data for transmission.

35. A digital signal processing apparatus for demodulating pre-coded data in a communication system, comprising:

memory storage unit; and

- a digital signal processor communicatively coupled to said memory storage unit, and capable of executing instructions to:
- 6 accept a reference data and a pre-coded data;

determine demodulating parameters in accordance with the accepted

8 reference data and the reference data; and

demodulate the pre-code data in accordance with the determined demodulating parameters.

36. An apparatus for pre-coding in a communication system, 2 comprising:

means for determining a pre-coder parameters;

- means for transmitting said pre-coded first data and a non pre-coded first 6 reference data.
- 37. An apparatus for demodulating pre-coded data, comprising: means for receiving a reference data and a pre-coded data; and 2 means for determining demodulator parameters in accordance with the said received reference data and the reference data; and
- means for demodulating the pre-coded data in accordance with said determined demodulator parameters. 6
